

Greater Philadelphia, PA

Prepared June 2026

Water provider: Aqua Pennsylvania, North Wales Water Authority, Pennsylvania American Water, and others, depending on your town.

Here is what public testing shows about tap water across the western Philadelphia suburbs. The figures come from the EWG Tap Water Database and local utility 2024 water quality reports. Legal limits and health guidelines are two different things: water can meet every legal limit and still carry levels independent scientists flag as a concern. None of the readings below are illegal; several are well above EWG's health-based guidelines. For your exact street, the only way to know is to test.

What public testing shows

● Hard water	Regionally hard	Montgomery and Chester County water is classified hard to very hard. It scales fixtures, shortens water-heater life, and spots glassware.
● Disinfection byproducts (TTHMs, HAAs)	30 to 47 ppb across systems	Legal (limits 80 and 60 ppb) but well above EWG's health guideline at most local utilities. They form when chlorine meets organic matter.
● PFAS 'forever chemicals'	Detected across the region	Some local wells are under active PFAS treatment. The new federal limit set in 2024 is 4 ppt, and several area systems run close to it.
● Chlorine / chloramine	Used by area utilities	Local systems disinfect with chlorine or chloramine, which can leave a taste and odor and need the right carbon filter to remove.
● On a private well?	Unregulated, untested	Private wells are not tested by anyone but the owner. If you are on a well, your water has likely never been checked.

Want to know what's in YOUR water?

These are area averages. Your home can read differently, especially on a private well or with older plumbing. We'll call you to go over your results and what your home actually needs.
